

Readers are Leaders®

IT Specifications and Requirements for Readers are Leaders Installation.

The installation comprises of three components:

- Server
- Admin
- Client

Hard Drive: Very little hard-drive space is required. A. Hard-drive of 320Gb or better will suffice.

System Memory: System memory of 1Gb would suffice, even though at least 4Gb or more is (Highly) recommended.

Network: It runs on an ordinary TCP/IP network, and is not very resource intensive. A network port is thus essential, wi-fi or ethernet.

Graphics: The program can be run on 800x600 resolution, but 1024x768 or better is recommended.

Server Module

The server component is normally run on an actual server, although it can also be run from an ordinary Windows desktop-computer or laptop. It merely functions as a file-server.

The server module itself consumes less than 300Mb, and the data-file used rarely exceeds 10Mb.

The module can run on most Windows platforms, 32bit or 64bit, including Windows 7, Windows 8, Windows 10, Windows 11, Server 2003, Server 2008, Server 2012 , Server 2016 and on Server 2019. (I have not yet confirmed that it will run on Server 2022, but have no doubts that it will).

It is critical to note that the computer the server module is run from, must be up and running, the server module (Dserver) needs to be running (Usually started at computer startup) and the computer must be logged onto.

Admin Module

The Admin module can be run on any Windows desktop computer, or laptop(s). The person(s) tasked with managing the Readers are Leaders classes and users, normally have it installed on their computer(s).

Client Module

The Client module can be run on any Windows desktop computer, thin-client or laptop(s). The client computer is the least resource intensive unit. This is the computer each reader will use to run the program.
